¹⁾ - The transducer has an universal input. One must give in the order, the code of the input signal (table 1) which has to be programmed.

²⁾ - After agreeing with the manufacturer.

³⁾ - Possible version with self-locking sockets.

The transducer maintains its class index up to a fourfold decrease of the basic range input signal. In the P12U-1 transducer order, besides the basic range, one must give the required sub-range. In case when the given sub-range is lower than the basic range, divided by four, one must specify the input signal in the order as XX.

Order example:

The code: **P12U-1.05.1.1.0.00.8 - 0...400 Ω sub-range** means:
P12U transducer without a display, programmed by the manufacturer to co-operate with a thermocouple of J type in the measuring sub-range 0...400°C, voltage analog output: 0...10 V, supply voltage: 85...253 V a.c./d.c., socket-plug screw terminals, standard version, without extra quality requirements.
