## **1 APPLICATION**

ND20CT meter is a digital programmable panel meter designed to measure parameters of singlephase 2-wire and three-phase 3 and 4-wire power networks, working with external current transformers:

- 3-phase with RJ12 connector and 100 mA output, LJ series integrated in one housing,

- 1 phase with RJ11 connector and 100 mA LJ output, via splitter,

- 3-phase with wires for screw terminals and 250 mA output, L3xx series integrated in one housing,

The use of RJ12 connectors makes the connection of the current transformers fast, easy, reliable and eliminates faulty connections.

Measured values are shown on a dedicated LCD display. The meter enables controlling and optimizing the operation of power electronics devices, systems and industrial installations.

It provides measurement of: RMS voltage and current, active, reactive and apparent power, active and reactive energy, power factor, frequency, 15-, 30-, 60-minute mean active power, THD measurement. Additionally, the current value in the neutral wire is calculated. Voltages and currents are multiplied by given voltage and current ratios of measuring transformers Indications of power and energy take into consideration values of programmed ratios. The value of each measured quantity can be transmitted to the master system through the RS-485 interface. The relay output signals the overflow of the chosen quantity, and the impulse output can be used for the consumption check of 3-phase active and reactive energy. The meter has the detection and signaling of an incorrect phase sequence.

The meter has a galvanic separation between respective blocks:

- power supply,
- RS-485 output,
- impulse output,
- analog output,
- voltage and current inputs.

The voltage and current inputs are not separated from each other - they are on a common potential.

## **2 METER SET**

Complete set of the Analyzer includes:

- ND20CT meter	1 pc.
- User's Manual:	1 pc.
- warranty card	1 pc
- seal	1 pc
<ul> <li>holders to fix the meter in the panel</li> </ul>	4 pcs.

## **3 BASIC REQUIREMENTS, OPERATIONAL SAFETY**

In terms of operational safety, the meter meets the requirements of EN 61010-1.

Safety instructions:

• The meter installation and connection should be made by qualified personnel. All available protection requirements must by taken into consideration.

• Before turning on the meter verify the connections.

• Prior to removing the meter housing, always turn the supply off and disconnect the measurement circuits.

- Before removing the connection cable from the RJ12 connector, make sure that the circuit is disconnected because hazardous voltage can occur on the plug of the connecting cable.
- Removal of the meter housing during the warranty period voids the warranty.
- The meter meets the requirements for electromagnetic compatibility in industrial environment.

• A switch or a circuit-breaker should be installed in the building or facility. It should be located near the device, easily accessible to the operator, and suitably marked.

## **4 INSTALLATION**

The synchronizing unit is adapted to be fixed to the panel by means of holders, according to fig. 1. The housing of the meter is made of plastic.

Housing dimensions are 96 x 96 x 77 mm. Outside the meter there are screw terminal strips that allow connection of external wires with a cross-section up to  $2.5 \text{ mm}^2$ .

A cut-out of 92.5+0.6 x 92.5+0.6 mm must be made in the panel. The thickness of the material from which the panel is made must not exceed 6 mm. The meter should be inserted from the front of the panel with the power supply disconnected. After inserting into the hole, fix the meter by means of holders

Fig. 1: Meter fitting

Fig. 2: Meter overall dimensions

## **5 METER DESCRIPTION**

#### 5.1 Current inputs

The meter is adjusted to work with external measuring current transformers with 100 mA outputs (RJ12 connector) or 250 mA outputs (screw terminals). Displayed values of currents and derivative quantities are automatically converted according to the introduced external current transformer ratio.

#### 5.2 Voltage inputs

Quantities on voltage inputs are automatically converted acc. to the introduced ratio of the external voltage transformer Voltage inputs are defined in the order as 3 x 57.7/100 V or 3 x 230/400 V.

#### **5.3 Connection diagrams**

Fig. 3: Examples of meter connections:
a) with a 1-phase current transformer with RJ12 output,
b) with a 3-phase current transformer with RJ12 output,
c) with 3 1-phase current transformers connected via a splitter,
d) with a 3-phase current transformer with an output for screw terminals.

## 6 ND20CT PROGRAMMING

#### 6.1 Frontal panel

#### Description of the frontal panel:

1 – abandon push-button – ESC	11 – units of displayed values			
2 – push-button to displace to the left	12 – symbols of digital data transmission			
3 – push-button to decrease the value	13 – multipliers of basic values			
4 – push-button to increase the value	14 – symbols of alarm switching on /			
5 – push-button to displace to the right	occurrence			
6 – acceptance push-button ENTER	15 – symbols of THD value display			
7 – symbol of displayed value of averaged active	16 – symbols of energy flow			
power	17 – symbols of min / max quantities			
8 – display field of mean values, frequency, time, power	18 – symbols of quantity affiliation to respective			
guard	phase			
9 – display field of basic quantities, energy, THD	19 – symbols of power, energy character			
10 – symbols indicating the display of power factor,	20 – symbol of 3-phase quantity display			
power tangent and THD (row 4)				

#### 6.2 Messages after Switching the Supply on

After switching the supply on, the meter performs the display test and displays the ND20CT meter name, version, serial number and the current program version.

#### Fig. 5: Messages after starting the meter

where: oooooooo is the serial number, r n.nn is the number of the current program version or the number of the custom-made version, bnnn is the bootloader version number.

# Caution! If the display shows the message Err Cal or Err EE, it is necessary to contact the service.

#### 6.3 Monitoring of Parameters

In the measuring mode, quantities are displayed acc. to settled tables Pushing the push-button (left) or push-button (right) causes the transition between displayed quantities. Pushing the quantities push-button (Enter) causes the transition between mean and additional displayed values. Pushing the vush-button (down) causes the monitoring of the minimum value, however the pressure of the push-button (up) causes the monitoring of the maximum value. Pushing the vestbox (ESC) push-button during the monitoring of these values, erases minimum or maximum values respectively. Through the RS-485 interface one can set up the values, that would be visualized.

The error display is described in the chapter 8.

When displaying the reactive power, a marker indicating the load character is displayed, capacitive (+) or inductive (--).

Displayed quantities in the field 9 (fig. 5.) for 3-phase 4-wire measurement mode 3Ph/4W and single-phase 1Ph/2W are presented in the table 1a and 1b.

Performing calculation:

Reactive power (configured calculation method):

$$Q = \sqrt{S^2 - P^2}$$

or 
$$Q = \sum_{i=1}^{k} U_i * I_i * \sin(\angle U_i, I_i)$$
, where k – harmonics number (k = 21 for 50 Hz, k = 18 for 60 Hz)

Power factor PF PF = P / STangent factor:  $tg \varphi = Q / P$ Cosine: the cosine of the angle between *U* and *I* 

Exceeding of the upper indication range is signaled on the display by upper horizontal lines, and the exceeding of the lower range is signaled by lower horizontal lines. In case of averaged power measurement  $P_{3phase}$  single measurements are carried out with a 15 seconds' quantum. Respectively for the selection: 15 min, 30 min, 60 min, 60, 120 or 240 measurements are averaged. After starting the meter or the power erasing, the first value will be calculated after 15 seconds since the meter switching on or erasing. Till the time all active power samples are obtained, the value of averaged power is calculated from already measured samples.

The current in the neutral wire  $I_{(N)}$  is calculated from phase current vectors.

The value of consumed ordered power can be used for a previous warning against the exceeding of ordered power and to avoid related fines. The consumption of ordered power is calculated on the base of time interval set for the synchronization of the mean active power and the value of ordered power (section 6.5.1). An example of consumption is presented in the section 6.5.3. The alarm switching on is signaled by the lighting of the AL1 inscription (in the mode A3non, A3nof, A3\_on, A3\_of: the inscriptions are AL1, AL2, AL3). The end of alarm duration at the alarm signaling support switched on, is indicated by the pulsation of the AL1 inscription (in the mode A3non, A3nof, A3\_on, A3\_of: the inscriptions are AL1, AL2, AL3) inscriptions.

#### 6.4 Operating Modes:

#### Fig. 6: Operating modes of the ND20CT meter

#### 6.5 Parameter Settings

For the configuration of ND20CT meters, we provide free eCon software available at <u>www.lumel.com.pl</u>.

Fig. 7: Setup menu

The entry in the programming mode is carried out through pressing and holding of the ushbutton during ca 3 sec. The entry in the programming mode is protected by the access code. If there is not such a code, the program transits into the programming option. The inscription **SET** is displayed (in the first row) and the first group of **PAr** parameters The monitoring of parameters is always available through pressing and holding down the **PAP** push-button during ca 3 sec.

4	Secondary current of current transformer	ct_S	0.1 or 0.25	0 – 0.1 A; 1 – 0.25 A	1
5	Ratio of voltage transformer	tr_U	0.14000.0		1
6	Synchronization of mean active power	SYn	15, c_15, c_30, c_60	Synchronization of mean active power: 15 – 15-minute movable window (record synchronized with the clock every 15 minutes) c_15 – measurement synchronized with the clock every 15 minutes, c_30 – measurement synchronized with the clock every 30 minutes, c_60 – measurement synchronized with the clock every 60 minutes,	15
7	Storage of minimum and maximum values with errors	ErLI	oFF, on	oFF – storage of only correct values (from the measuring range), on – storage of also error occurrences in measurements (values in registers 1e20 and -1e20)	on
8	Method to calculate reactive power	q_t	trGLE, SInUS	trGle: $Q = \sqrt{S^2 - P^2}$ SINUS: $Q = \sum_{i=1}^{k} U_i * I_i * \sin(\angle U_i, I_i)$ k – harmonics number, k = 21 for 50 Hz, k = 18 for 60 Hz	trGLE
9	Method to calculate reactive energy	En_q	cAP, SIGn	cAP – inductive and capacitive energy SIGn – positive and negative energy	cAP
10	Display backlit	LGHt	oFF,160, on	off – disabled, on – enabled, 160 – time in seconds of backlit support from the push- button pressing.	on
11	Resetting watt-hour meters	En_0	no, EnP, Enq, EnH, ALL	no – lack of actions, EnP – erasing of active energy, Enq – erasing of reactive energy, EnS - erasing of apparent energy. ALL – erasing of all energy	no
12	Erasing of mean active power	PA_0	no, yES	yES – erasing of power	no
13	Ordered power	PAor	0144.0	Ordered power for forecasting the power consumption in % of the rated value	100.0
14	Measurement mode	conn	3Ph-4, 3Ph-3, 1Ph-2	Meter connection method	3Ph-4
15	Hour, minute	t_H	023, 059	00,00 (seconds are reset after the setting)	
16	Factory parameters	dEF	no, yES	restoring the group factory parameters	no

The automatic erasing of energy is carried out:

- for active energy when changing: voltage or current ratio;

- for reactive energy when changing: voltage or current ratio, the way of reactive power calculation, reactive energy calculation;

Values are set by means of  $\checkmark$  and  $\checkmark$  push-buttons, however the position of the set digit is selected by means of  $\checkmark$  and  $\blacktriangleright$  push-buttons. The active position is indicated by the cursor. The value is approved by the  $\checkmark$  push-button and rejected by pressing the  $\backsim$  push-button. During the acceptance, it is checked if the value is in the range. In the case when the value is set beyond the range, the meter remains in the parameter edition mode, and the value is set to the maximum value (when the value is too high) or to the minimum value (when the value is too low).

Table 1

#### 6.5.2 Setting of Output Parameters

Select the **out** mode in options and confirm the choice by the **ush-button**.

					Table 4

\*Un, In - rated values of voltages and currents

Fig 9. Alarm types: a),b) normal c) disabled d) enabled.

#### Other alarm types:

H-on – always enabled;

H-oFF – always disabled,

– A3non – when alarm type n-on occurs on any phase - the switching relay is switched on and relevant symbol lights up (AL1 – phase 1, AL2 – phase 2, AL3 – phase 3). It will be disabled only when all alarms disappear.

- A3nof – when alarm of n-off type occurs on any phase - the switching relay is switched on and relevant symbol lights up (AL1 – phase 1, AL2 – phase 2, AL3 – phase 3). It will be disabled only when all alarms disappear.

- A3\_on – when alarm of on type occurs on any phase - the switching relay is switched on and relevant symbol lights up (AL1 – phase 1, AL2 – phase 2, AL3 – phase 3). It will be disabled only

when all alarms disappear.

- A3\_of – when alarm of off type occurs on any phase - the switching relay is switched on and relevant symbol lights up (AL1 – phase 1, AL2 – phase 2, AL3 – phase 3). It will be disabled only when all alarms disappear.

In the A3 alarm series the alarm value must come from the following range: 0-7. They work with the same hysteresis thresholds ALof and Alon for each phase. Alarms signaling maintaining is switched off after pressing the push-buttons and (for 3 sec).

#### Example 1 Programming an alarm with hysteresis

If we want to program the alarm operation in such a way that the alarm is activated at phase 1 current of 150A, and deactivated at the value of 100A, we should do the following:

- initially we must calculate the percentage value of current for alarm thresholds in relation to the nominal current, i.e. if 100% = 200A (for the programmed ratio of 200/0.1A), 100A = 50.0% and 150A = 75.0%
- enter the programming mode and select the level with the Alr1 symbol
- go to the Al\_n parameter and set I\_1
- go to the Al\_t parameter and select the function marked as n-on
- go to the Al\_of parameter and enter 50.0%
- go to the Al\_on parameter and enter 75.0%
- exit the programming mode

#### Example 2: Programming an alarm active in a set range with a switching delay

If we want the alarm for the voltage to be activated in the range between 200V - 250V for any of the three phases and to be activated only after 10 seconds we should:

- initially we must calculate the percentage value of voltage for alarm thresholds in relation to the nominal voltage, i.e. if 100% = 230V (the measuring range can be found in table 11), 200V ≈ 86.9% and 250V ≈ 108.6%
- enter the programming mode and select the level with the Alr1 symbol
- go to the Al\_n parameter and set U\_1
- go to the A1\_t parameter and select the function marked as A3\_of
- go to the **Al\_of** parameter and enter 87%
- go to the Al\_on parameter and enter 109%
- go to the **ALdt** parameter and enter **10**
- exit the programming mode

If the alarm condition lasts longer than 10 seconds, the meter will activate the alarm relay and the appropriate alarm symbol will be lit on the display (AL1 - phase 1, AL2 - phase 2, AL3 - phase 3). The relay will be switched off only when all alarms disappear and this state continues for more than 10 seconds.

# Example 3: Programming an alarm of earlier warning about the possibility of exceeding the ordered power

The ordered power is defined as the maximum value of average values of a 3-phase active power over a period of 15 minutes. If we want the alarm to be activated at 90% of the ordered power, and deactivated at 89%, then we should:

- Initially, we must calculate the percentage value of the power ordered in relation to the nominal power, i.e. assuming that the current transformer ratio is 250/0.25A, and the the voltage value is 230V, then the 3-phase nominal active power will be P = 3\* 230V\*250A = 172.5 kW. Assuming the ordered power as 100kW, it will represent approximately 57.9% of the nominal power
- enter the programming mode and select the level with the **Par** symbol

- go to the **PAor** parameter and enter 57.9
- go to the syn parameter and set 15 (synchronization with a 15-minute moving window) or c\_15 (clockwise synchronization every 15 minutes); the factory setting is 15
- go to the level with the Alr1 symbol
- go to the Al\_n parameter and set P\_ord
- go to the Al\_t parameter and select the function marked as n-on
- go to the Al\_of parameter and enter 89.0%
- go to the Al\_on parameter and enter 90.0%
- exit the programming mode

Knowing the maximum instantaneous power consumption, you can optimize the alarm switching cycle, which will not result in exceeding of the ordered power. Assuming for the above example that the instantaneous power  $P_{MAX} = 150$ kW and knowing that the power synchronization is within 15min (900sec), the delay of alarm switching can be set to the value calculated from the formula  $t = (100\% - 90\%)^* ((100$ kW \* 900s))/172.5kW) = 60s

Figure 10 shows an example of using the value of the used ordered active power parameter to activate the alarm. The delay time is set to 0 seconds. In the example calculation the devices could work for another 60 seconds for the remaining 10% of the ordered power at the maximum power consumption, without exposing the recipient to penalties. When the delay time is set to 60 seconds, the alarm will not be activated.

#### 6.5.4 Setting displayed quantities

Select the **dISP** mode in options and approve the choice by the **ush-button**.

## **7 UPDATING SOFTWARE**

ND20CT meters have a feature that allows the user to upgrade the software using a PC with eCon software. Free eCon software and update files are available on <u>www.lumel.com.pl</u>. RS485 to USB converter connected to a computer is needed to perform the upgrade, e.g.: PD10 converter.

e-Con		LUMEL UPDATER v.2.11	2

Fig.11 View of program window: a) eCon, b) firmware upgrade

**Caution!** After upgrading the software, the user should set the factory settings of the meter, thus it is recommended to preserve the initial meter parameters before the upgrade with the use of eCon software.

After starting eCon the serial port, baud rate, mode and the meter address should be set in the settings. Next, select the ND20CT meter from the Devices menu and click on the Readout icon to read all the parameters set (needed for their later restoration). After selecting the option Update device firmware from the Update menu, the Lumel Updater window (LU) will open - Fig. 11 b. Press Connect. Messages information window contains info about the progress of the upgrade process. When the port is properly opened the display shows: Port opened. There are two ways to enter the upgrade mode: remotely through the LU (based on the settings in eCon - address, mode, baud rate, COM port) and by turning the meter power on when the push-button is pressed. The display will show "boot" with bootloader version, and LU program will show the message Device found and the name and program version of the connected device. Press the ... button and select the meter update file. When the file is properly opened File opened message is displayed. Press the Send button. After successful upgrade the meter switches to normal operation, the information window shows *Done* and the upgrade duration. After closing the LU window, go to Restore factory settings parameter group, select the option and press the Apply push-button. Then press the Record icon to save the parameters set at the beginning. The current software version can also be checked by reading the greeting messages of the meter after powering up.

**Caution!** Turning off the power during the software upgrade may result in permanent damage to the meter!

## 8 RS-485 INTERFACE

The implemented protocol is in accordance with the PI-MBUS-300 Rev G of Modicon Company. The list of serial link parameters of ND20CT meter:

- ID
- meter address
- baud rate 4.8, 9.6, 19.2, 38.4 kbit/s,
- operation mode Modbus RTU,
- information unit 8N2, 8E1, 8O1, 8N1,
- maximum response time when requesting for archive 600 ms.

0xE3

1..247

- maximum number of read registers in one query
  - 41 registers 4 byte,
  - 82 registers 2 byte,
- implemented functions 03, 04, 06, 16, 17,
  - 03, 04 registers reading,
    - 06 one register record
    - 16 n registers record,
    - 17 device identification

Default settings: address 1, baud rate 9.6 kbit/s, RTU 8N2 mode,

#### Readout of n-registers (code 03h)

Example 1. Readout of 2 16-bit registers of integer type, starting with the register addressed 0FA0h

(4000) - registers values 10, 100.

#### Request:

Device address		Register	address	Number o	f registers	Checksum CRC
	Function	B1 B0		B1 B0		
01	03	0F	A0	00	02	C7 3D

Response:

Device address	Function	Number of bytes		Value from the register 0FA0 (4000)		<b>o</b>		Checksum CRC
			B1	B0	B1	B0		
01	03	04	00	0A	00	64	E4 6F	

**Example 2.** Readout of 2 32-bit registers of float type as a combination of 2 16-bit registers starting with the register addressed 1B58h (7000) - registers values 10, 100.

Request:

Device address		Register	address	Number o	f registers	Checksum CRC
	Function	B1	B0	D B1 B0		
01	03	1B	58	00	04	C3 3E

#### Response:

Device address	Function	Number of bytes	Value from the register 1B58 (7000)		Value from the register 1B59 (7001)		Value from the register 1B5A (7002)		Value from the register 1B5B (7003)		Checksum CRC
			B3	B2	B1	B0	B3	B2	B1	B0	
01	03	08	41	20	00	00	42	C8	00	00	E4 6F

**Example 3.** Readout of 2 32-bit registers of float type as a combination of 2 16-bit registers starting with the register addressed 1770h (6000) - registers values 10, 100.

Request:

Device address		Register address		Number o	Checksum CRC	
	Function	B1	B0	B1	B0	
01	03	17	70	00	04	4066
01	03	17	70	00	04	400

Response:

Device address	Function	Number of bytes	Value from the register 1770h(6000)		Value from the register 1770h(6000)		Value from the register 1772h(6002)		Value from the register 1772h(6002)		Checksum CRC
			B1	B0	B3	B2	B1	B0	B3	B2	
01	03	08	00	00	41	20	00	00	42	C8	E4 6F

**Example 4.** Readout of 2 32-bit registers of float type, starting with the register addressed 1D4Ch (7500)

- register values 10, 100.

Request:

Device address		Register address		Number o	Checksum CRC	
	Function	B1	B0	B1	B0	
01	03	1D	4C	00	02	03 B0

Response:

Device address	Function	Number of bytes	Val	Value from the register 1D4C (7500)		Value from register 1D4D (7501)				Checksum CRC	
			B3	B2	B1	B0	B3	B2	B1	B0	
01	03	08	41	20	00	00	42	C8	00	00	E4 6F

#### Readout of single register (code 06h)

**Example 5.** Record of 543 (0x021F) value to register 4000 (0x0FA0)

Request:

Device address		Register address		Registe	Checksum CRC	
	Function	B1	B0	B1	B0	
01	06	0F	A0	02	1F	CA 54

#### Response:

Address of the		Address of the register		Register value		Checksum CRC
device	Function	B1	B0	B1	B0	
01	06	0F	A0	02	1F	CA 54

#### Saving to n-registers (code 10h)

**Example 6.** Recording 2 registers, starting with the register addressed 0FA3h (4003)

Recording values 20, 2000.

#### Request:

Address of the device	Function		of			Number of bytes		reg. 0FA3 03)		reg. 0FA4 004)	Checksum CRC
			reg.Lo				B1	B0	B1	B0	
01	10	0F	A3	00	02	04	00	14	07	D0	BB 9A

Response:

Device address		Register address		Number o	Checksum CRC	
	Function	B1	B0	B1	B0	
01	10	0F	A3	00	02	B2 FE

#### Report identifying the device (code 11h)

#### Example 7. Device identification

Request:

Device address	Function	Checksum
01	11	C0 2C
Posponso:		

Response:

Addres s	Function	Number of bytes		Device state	Information field for device software version (e.g. "ND20CT- 0.91 b-1.05" - ND20CT device with software version 0.90 and bootloader version 1.05)	Checksum (CRC)
01	11	1D	E3	FF	4E 44 32 30 43 54 2D 30 2E 39 31 20 20 20 20 20 20 20 20 62 2D 31 2E 30 35 20	55 00

#### 8.1 MAP OF ND20CT REGISTERS

In ND20CT meter the data is placed in 16- and 32-bit registers. Process variables and parameters of the meter are located in the address space of registers in a manner dependent on the type of the variable. Bits in 16-bit register are numbered from the most recent to the oldest one (b0-b15). 32-bit registers contain floating point numbers in IEEE-754 standard.

		Table 8					
Address range	Value type	Description					
4000 – 4061	Integer	Value placed in one 16-bit register. Description of registers can be					
4000 - 4061	(16 bits)	found in table 9. Registers for recording and reading.					
6000 – 6339	Float (2x16 bits)	Values placed in two successive 16-bit registers. Registers contain the same data as 32-bit registers of 7500 – 7659 range. Read-only registers. Byres order (1-0-3-2)					

7000 – 7339	Float (2x16 bits)	Values placed in two successive 16-bit registers. Registers contain the same data as 32-bit registers of 7500 – 7659 range. Read-only registers. Byres order (3-2-1-0)
7500 – 7669		Value placed in one 32-bit register. Description of registers can be found in table 10. Read-only registers.

			Table 9	
Register address	Ope- rations	Range	Description	Default
4000	RW	060000	Protection - password	0
4001	RW	01	Sequence of phases 0 - 123 1 - 321	0
4002	RW	160000	Nominal value of current on the primary side of current transformer (*100)	100
4003	RW	0.1	Nominal value of current on the secondary side of current transformer 0 – 100 mA, 1 – 250 mA	0
4004	RW	140000	Ratio of voltage transformer * 10	10
4005	RW	03	<ul> <li>Synchronization of mean active power:</li> <li>0 – 15-minute movable window (record synchronized with the clock every 15 minutes)</li> <li>1 – measurement synchronized with the clock every 15 minutes,</li> <li>2 – measurement synchronized with the clock every 30 minutes,</li> <li>3 – measurement synchronized with the clock every 60 minutes,</li> </ul>	0
4006	RW	01440 [ <b>°/₀₀</b> ]	01440 [°/ <sub>∞</sub> ] Average ordered power * 10 of nominal signals	
4007	RW	0.1	Minimum and maximum values storage method 0 -	
4008	RW	0.1	Method to calculate reactive power: 0 - $Q = \sqrt{S^2 - P^2}$ 1 - $Q = \sum_{i=1}^{k} U_i * I_i * \sin(\angle U_i, I_i)$ k - harmonics number, k = 21 for 50 Hz, k = 18 for 60 Hz	0
4009	RW	0.1	Method to calculate reactive energy:	
4010	RW	061	Display backlit: 0 - off 1-60 – backlit time in seconds from button press, 61 – always on	61
4011	RW	04	Resetting energy meters: 0 – no changes, 1- reset active energies, 2 – erase reactive energies, 3 – erase apparent energies, 4 – erase all energies	0
4012	RW	0.1	Erasing of mean active power P <sub>AV</sub>	0
4013	RW	0.1	Erase min and max	0
4014	RW	0900 [s]	Interlocking time of the renewed switching on the relay output	0
4015	RW	0.135	Quantity on the alarm relay output	

ND20CT-09A User's manual

			ND20CT-09A User's manual	
4016	RW	09	Output type: 0 – n-on, 1– n-oFF, 2 – on, 3 - oFF, 4 – H-on, 5 – H-oFF, 6 - A3non, 7 - A3nof, 8 - A3_on, 9 - A3_of	0
4017	RW	-144001440 [ <b>°/</b> ₀₀]		
4018	RW	-144001440 [⁰/₀₀]	Upper alarm switching value of the rated input range	1010
4019	RW	0900 s	Delay of the alarm switching (for quantity AL_n = P_ord – rgister 4015 =35, the delay occurs only when the alarm is switched on.	0
4020	RW	0.1	Maintaining alarm signaling	0
4021	RW	0.135	Quantity on the continuous output no. 1 / code acc. to tab.6 /	24
4022	RW	0.1	Type of continuous output 0 – 020 mA; 1 – 420 mA	0
4023	RW	-144001440 [° <b>/</b> ₀₀]	Lower value of the input range in [%] of the rated input range.	0

In neverthesis [1] vales and the exclusion on writin placed						

In parenthesis [], relevant resolution or unit is placed.

Energy is made available in hundreds of watt-hours (var-hours) in double 16-bit register, and for this reason, they must be divided by 10 when calculating values of particular energy from registers, i.e.: Imported active energy = (register 4038 value x 65536 + register 4039 value) /10 [kWh] Exported active energy = (register 4040 value x 65536 + register 4041 value) /10 [kWh] Reactive inductive energy = (register 4042 value x 65536 + register 4043 value) /10 [kWh] Reactive capacitive energy = (register 4044 value x 65536 + register 4045 value) /10 [kVarh] Reactive capacitive energy = (register 4044 value x 65536 + register 4045 value) /10 [kVarh] Apparent energy = (register 4016 value x 65536 + register 4047) / 10 [kVAh]

Device status register (address 4050, R):	Pit 7 "1" the interval of averaged power has not
Bit 15 – "1" – non-volatile memory corruption	Bit 7 – "1" – the interval of averaged power has not elapsed
Bit 14 – "1" – no calibration or erroneous calibration	n Bit 6 – "1" – frequency for THD calculation beyond intervals:
Bit 13 – "1" – error of parameter values Bit 12 – "1" – error of energy values Bit 11 – "1" – error of phase sequence Bit 10 – current range "0" – 0.1 A~; 1" – 0.25 A~	<ul> <li>48 – 52 for frequency 50 Hz,</li> <li>58 – 62 for frequency 60 Hz</li> <li>Bit 5 – "1" – voltage too low for frequency measurements</li> <li>Bit 4 "1" too low voltage of phase L3</li> </ul>
Bit 9 Bit 8 voltage range	Bit 4 – "1" – too low voltage of phase L3 Bit 3 – "1" – too low voltage of phase L2
0 0 57.7 V~	Bit 2 – "1" – too low voltage of phase L1 Bit 1 – "1" – reserved
0 1 230 V~	Bit 0 – state of relay output "1" – On, "0" - off
Status Register 2 - nature of reactive power (addres	ss 4061, R):
Bit 15 – reserved Bit 14 - "1" – signaling of alarm occurrence in phase L3 ( only for alarm types A3non, A3nof, A3_on, A3_of)	Bit 10 – "1" – capacitive 3L minimum Bit 9 – "1" – capacitive 3L Bit 8 – "1" – capacitive L3 maximum Bit 7 – "1" – capacitive L3 minimum
Bit 13 - "1" – signaling of alarm occurrence in phase L2 ( only for alarm types A3non, A3nof, A3_on, A3_of)	Bit 6 – "1" – capacitive L3 Bit 5 – "1" – capacitive L2 maximum Bit 4 – "1" – capacitive L2 minimum
Bit 12 - "1" – signaling of alarm occurrence in	Bit 3 – "1" – capacitive L2
phase L1 ( for alarm types n-on, n-off, on,	Bit 2 – "1" – capacitive L1 maximum
off signals alarm occurrence) Bit 11 – "1" – capacitive 3L maximum	Bit 1 – "1" – capacitive L1 minimum Bit 0 – "1" – capacitive L1

Configuration register of displayed parameters of standard values (address 4054, R/W):

- Bit  $15 "1" displaying cosine \phi \, \omega \alpha \lambda \upsilon \epsilon$
- Bit 14 "1" displaying current THD
- Bit 13 "1" displaying voltage THD
- Bit 12 "1" displaying apparent energy
- Bit 11 "1" displaying reactive capacitive energy
- Bit 10 "1" displaying reactive inductive energy
- Bit 9 "1" displaying active exported energy
- Bit 8 "1" displaying active imported energy Bit 7 - "1" - displaying tgBit 6 – "1" – displaying PF Bit 5 - "1" – displaying phase apparent powers Bit 4 – "1" – displaying phase reactive powers Bit 3 – "1" – displaying phase active powers Bit 2 - "1" - displaying phase currents Bit 1 – "1" – displaying phase-to-phase voltages Bit 0 - "1" - displaying phase voltages

Configuration register of displayed parameters of standard values 2 (address 4056, R/W):

Bits 15 ... 1 - reserved

Bit 0 – "1" – displaying power  $\Sigma P$ ,  $\Sigma Q$ ,  $\Sigma S$ 

Configuration register of displayed parameters of average values (address 4055, R/W):

- Bits 15 ... 14 reserved
- Bit 13 "1" displaying average current THD
- Bit 12 "1" displaying average voltage THD
- Bit 11 "1" displaying ordered power
- consumption
- Bit 10 "1" displaying frequency
- Bit 9 "1" displaying time
- Bit 8 "1" displaying average cosine  $\varphi$

- Bit 7 "1" displaying averaged active power
- Bit 6 "1" displaying average tg
- Bit 5 "1" displaying average PF
- Bit 4 "1" displaying power  $\Sigma S$
- Bit  $3 "1" displaying power \Sigma Q$
- Bit 2 "1" displaying power  $\Sigma P$ 
  - Bit 1 "1" displaying current in neutral wire
- Bit 0 "1" displaying average current

In the case of the lower overrun, the value -1e20 is entered, while in the case of upper overrun or error occurrence the value 1e20 is entered.

### **9 ERROR CODES**

During operation of the meter, error messages may appear on the display. The causes of the errors are listed below.

- Err1 – when the voltage or current is too small when measuring:

- PF <sub>i</sub> , tgφ <sub>i</sub> , cos, THD	below 10% U <sub>n</sub> ,
- PF <sub>i</sub> , tgφ <sub>i</sub> , cos	below 1% I <sub>n</sub> ,
- THD	below 10% I <sub>n</sub> ,
- f	below 10% U <sub>n</sub> ,
- I <sub>(N),</sub>	below 10% In;

- **bAd Freq** when measuring harmonics and THD, if the frequency value is beyond the interval 48 52 Hz for 50Hz and 58 62 for 60 Hz;
- **Err CAL, Err EE** displayed when the memory of the meter is corrupted. The meter must be sent to the manufacturer.
- **Err PAr** displayed when the operating parameters of the meter are incorrect. Restore the factory settings (from the menu or via RS-485). The message can be turned off with the button  $\bigcirc$ .
- **Err Enrg** displayed when the energy values in the meter are incorrect. The message can be turned off with the button . Incorrect energy values are reset.
- Err L3 L2 error of phase sequence, interchange the connection of phase 2 with phase 3 The message can be turned off with the button . Each time the meter is powered up, the message will be displayed again.
- \_ \_ \_ or \_ \_ \_ \_ lower overrun. The measured value is lower than the lower measuring quantity range.\_\_\_\_
- or upper overrun. The measured value is higher than the upper measuring quantity range.

## **10 TECHNICAL DATA**

#### Measuring ranges and admissible basic errors

Table 11

00							
Measured quantity	Indication range*	Measuring range	L1	L2	L3	Σ	Basic error
Current In 0.1 A 0.25A	0.00 999.9 A 0.00 999.9 A	0.0002 0.1200 A 0.0005 0.3000 A	•	•	•		±0,2 % r.

Cosine φ	-1 1	-1 1	•	•	•	•	±1 % r.
φ	-180 180	-180 180	•	•	•		±0,5 % r.
Active imported energy	099 999 999,9 kWh					•	±0,5 % m.v.
Exported active energy	099 999 999,9 kWh					•	± 0,5 % m.v.
Reactive inductive energy	099 999 999,9 kvarh					٠	± 0,5 % m.v.
Reactive capacity energy	099 999 999,9 kvarh					•	± 0,5 % m.v.
Apparent energy	099 999 999,9 kVAh					٠	± 0,5 % m.v.
THD	0100%	0100 %	•	•	•		±5 % r.

\*Depending on the set tr\_U ratio (ratio of the voltage transformer: 0.1 .. 4000.0)

and tr\_l ratio (ratio of the current transformer: 1 .. 6000.0)

m.v. - of the range

r - of the measured value

Measurement accuracy (basic error) applies to the meter without external transformers.

**Caution!** For the correct current measurement the presence of a voltage higher than 0.05 Un is required at least in the relevant phase. At voltage absence – measurement of current from app. 10 % of the rated current value.

**SAMPLE ORDER:** The code **ND20CT-2.1.1.00.P.1** - means a meter with input range of 3x 230/400 V, with programmable analog output 0(4) .. 20 mA, with supply voltage 85 ... 253 V a.c./ 90..300 V d.c. in standard version, Polish language version, with a quality inspection certificate.

## **12 ACCESSORIES**

#### 12.1 LJ series current transformers with RJ12 connector

The offer includes 1 and 3 phase transformers with an RJ12 LJ series connector.

The use of RJ12 connectors makes the connection of the current transformers fast, easy, reliable and eliminates faulty connections.

#### **Technical data:**

Maximum working voltage: 720V maximum, Test voltage / electrical strength /: 3kV 50 Hz for 1 minute, Frequency: 50/60Hz, Nominal primary current: 1-phase: 50 .. 250 A; 3 - phase: 60 .. 600 A, Nominal secondary current: 100mA, Overload Capability: 1.2 of rated current continuously, Fire resistance classification: UL94V-O Distance between conductor rails axes 25mm, 35mm, 45mm Ambient temperature: -20°C .. +85°C Accuracy class: 0.5, 1 acc. to EN 61869-2

#### Standard equipment for 1-phase current transformers:

LJ12 series transformer, with a connecting cable with an RJ12 connector, 1.5 m long - mounting set for rail mounting,

#### Standard equipment for 3-phase current transformers:

- LJ25, LJ35 or LJ45 series transformer including a connecting cable with RJ12 connector, 1.5 m long,

77,5

- mounting set for rail mounting,

#### 1 - phase current transformers

# **12.2 Current transformers of L3xx series for screw terminal connection**

The offer includes 3-phase L3xx transformers for connection to screw terminals.

#### **Technical data:**

Nominal primary current In: 63, 125, 250 A~ Nominal secondary current: 250 mA~ Nominal power: 0.1 VA Maximum working voltage: 720V maximum, Frequency: 50/60Hz, Accuracy class: 0.5, Thermal short-circuit current Ith: 60 x In Dynamic short circuit current: 2.5 x Ith Insulation class: E Degree of protection: IP20 Thermal Class: B Ambient temperature: -20°C ... +85°C Storage temperature: -40°C ... +90°C Fulfilled standards: IEC61869-1/2

#### Performance characteristics:

- high electrical insulation between the primary and secondary circuit,
- easy and safe electrical connection,
- 550 mm auxiliary conductor length for versions 63 and 125 A ~, 1550 mm for version 250 A ~

ND20CT-09A User's manual

#### 12.3 Splitter

When using LJ series 1-phase current transformers with RJ12 connector and 100 mA output, connection to the ND20CT meter is recommended to be done via the **ND20CT-303** splitter.

#### Standard equipment:

ND20CT-303 splitter,
connecting cable with RJ12 connector, 1.5m long index 20-810-03-00016 - 1 pc.;

Splitter - ND20CT-303
