#### 1. APPLICATION

NA5Plus series meters with a bar graph have a universal input designed to measure temperature, resistance, voltage from shunts, standard signals, dc voltage and dc current. They can be used in various industries, such as: food industry, pumping stations and sewage treatment plants, chemical industry, weather stations, meteorological stations, breweries. They are intended for the visualisation of the measured quantity and evaluation of change trends of controlled technological processes. They can also be used in automation systems where programmed controllers are applied.

NA5Plus meters have, depending on the version, one or two continuous outputs (voltage or current), 4 relay outputs or 8 open collector (OC) type outputs, as well as an RS-485 interface. The meters are programmable via the keyboard and via RS-485.

NA5Plus meters perform the following functions:

- measurement of the input quantity and displaying it on the display and the bar graph,
- recalculations of the input signal into indication on the base of the individual multipoint characteristics,
- arithmetical functions: raising to a power, extraction of roots,
- programming of colours and bar graph resolutions,
- signalling of exceeding the set alarm values;
- recording of the measured signal in programmed time intervals,
- storage of maximum and minimum values,
- programming of the measurement averaging time,
- programming of the indication resolution,
- deadlock of the parameter introduction by means of a password,
- conversion of the measured quantity into a voltage or current output signal,
- RS-485 interface support in MODBUS RTU protocol.

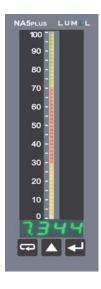

Fig. 1: View of NA5Plus meter.

#### 2. NA5PLUS SET

The complete set of NA5Plus meter includes:

- NA5Plus Meter 1 pc
- user's manual 1 pc
- signal terminal strip (16 terminals)
   2 pcs
- supply terminal strip (3 terminals)
- holders to fix the meter in the panel
   2 pcs

#### 3. BASIC REQUIREMENTS, OPERATIONAL SAFETY

Meaning of the symbols used in this manual:

#### Warning!

Warning of potentially dangerous situations. It is especially important to read and understand these instructions before connecting the device. Failure to meet the instructions that are marked with this symbol can result in serious injury of personnel and damage to the device.

#### Caution!

Generally useful notes. Following these instructions ensures easy operation of the device. The user must take them into account when the operation of the device does not meet the user's expectations.

Possible consequences when these instructions are not followed!

In terms of operational safety, the meter meets the requirements of DIN EN 61010-1.

#### Safety instructions:

- The assembly and the installation of the electrical connections may be carried out only by a duly qualified electrician.
- The person performing the installation is responsible for the safety of the system in which devices is installed.
- Before turning on the module verify the connections.
- Removal of the meter housing during the warranty period voids the warranty. The
  module power supply must be turned off and the input circuits disconnected before
  opening the housing.
- The device is intended for installation and use in industrial electromagnetic environments.
- A switch or a circuit-breaker should be installed in the building or facility. It should be located near the device, easily accessible to the operator, and suitably marked.
- In the event of damage, the meter can be repaired only by the service authorized by the manufacturer.
- Before using the repaired meter make sure that it is working properly.
- Connection of the meter and/or its usage inconsistently with this manual can reduce the operational safety of the meter.

#### 4. INSTALLATION

#### 4.1. Installation

The NA5Plus meter is designed to be mounted on a panel. For this purpose, a  $44.0 \times 137.5$  mm hole should be prepared in the panel. The thickness of the material from which the panel was made should be in the 1.45 mm range.

In the back of the meter housing there are detachable terminal strips, enabling connection of power supply, input signals, output signals and RS482 interface with wires with a cross-section of up to 2.5 mm2. The dimensions of the meter are shown in Fig. 2.

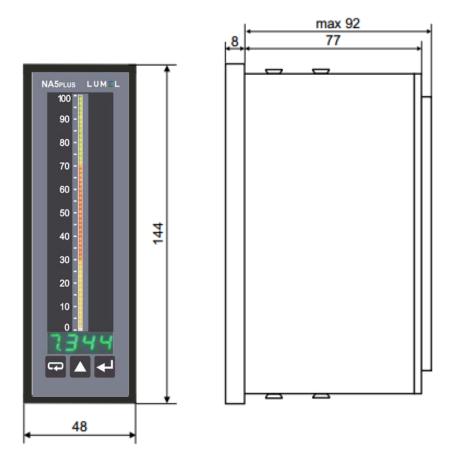

Fig. 2: Dimensions of the meter

### 4.2. External connections diagram

The connections of the meter are shown in Figure 3. In the event when the meter is powered with DC voltage, the voltage polarity does not matter.

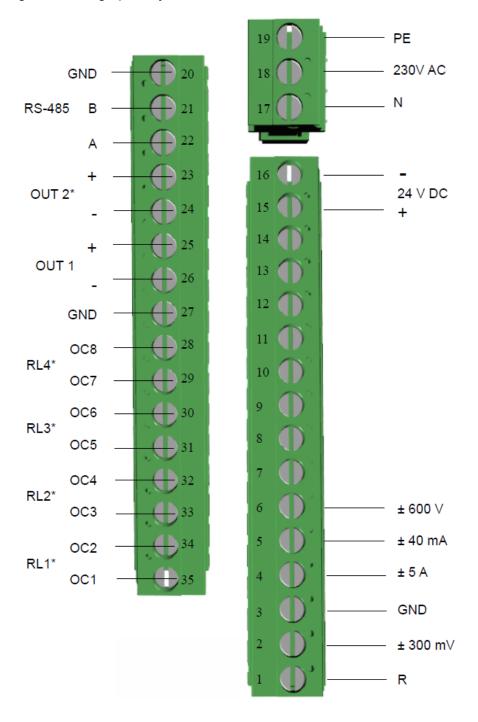

Fig. 3: Electrical connections of NA5Plus meter

<sup>\*)</sup> optional elements, depending on the meter's version

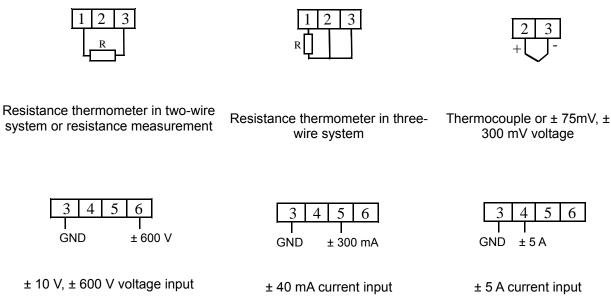

Fig. 4: Input signals connection method

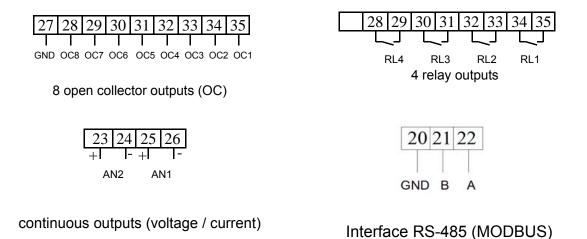

Fig. 5: Output signals connection method

#### depending on the version

Taking into consideration electromagnetic interference it is recommended to use shielded conductors for the connection of input and output signals. The power supply must be connected by means of a two-wire conductor with a suitable cross-section ensuring its protection by means of an installation fusible cut-out, in case of a short-circuit.

The requirements concerning the supply cable are regulated by EN 61010-1 p.6.10 standard.

#### 5. Operation

After connecting external signals and switching on the power supply, the meter displays the type and current version of the meter program.

After ca 3 seconds, the meter switches automatically to the operating mode in which it carries out measurements and displays the measured value on the display and the bar graph. Depending on alarm parameters settings, the resolution and bar graph type, alarm thresholds are also displayed on the bar graph. The meter blanks automatically insignificant zeros.

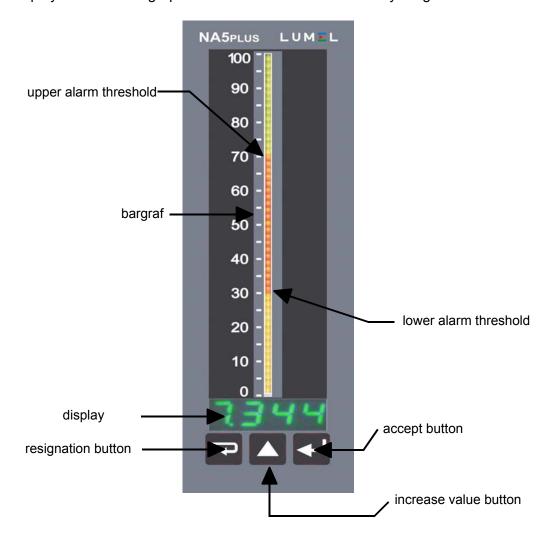

Fig. 6: Description of the front panel of the NA5Plus meter

#### Functions of the keys:

#### accept button

- entering the programming mode (hold this key for about 3 seconds).
- entering the chosen parameter level,
- entering the parameter value changing mode
- accepting the changed parameter value.

#### value increase key

- displaying the minimum and maximum values successively for subsequent measurement channels
- navigating the preview menu or programming matrix
- changing the value of the selected parameter increasing the value

#### cancel key

- entering the menu of registered results
- entering the parameter preview menu (hold for about 3 seconds)
- exit from the preview menu or programming matrix
- resignation from the parameter change

Pressing and holding the key for about 3 seconds causes entering the programming mode. The programming mode is secured with the **5**££ security code.

Pressing and holding the key for about 3 seconds causes entering the menu of the preview and the menu of recorded values. Navigating the preview menu is done using the key. In this menu, all programmable parameters of the meter are available for read-out, with the exception of service parameters. The exit from the preview menu is done by means of the key.

An overview of the recorded values is possible after pressing the key on the c 5 to parameter in the preview menu. The recorded result number is displayed alternately with the value e.g. a320/2174. Navigating the recorded values is done using the key. Holding this key for longer than about 2 seconds will speed up the browsing. Pressing the key at any time will display the number of recorded results. The exit from the viewing recorded values is done by pressing the key.

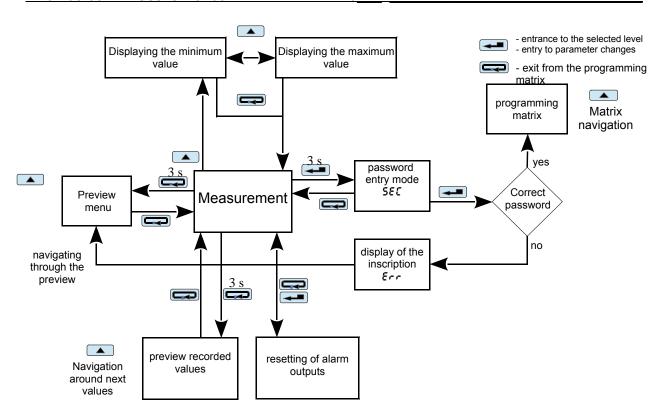

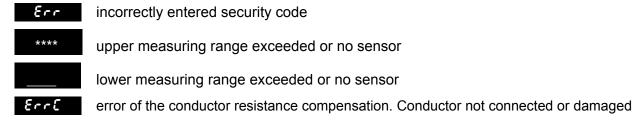

Fig. 7 The NA5Plus meter operation algorithm

Displaying the following symbols and inscriptions on the display means:

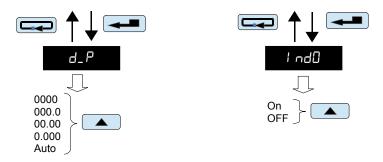

## 5.1 Changing meter parameters from the keyboard

Pressing the key for approx. 3 s causes the display of the SEC message alternately with the factory-set value of 0. Entering the correct code results in entering the programming mode. Figure 8 shows the transition matrix in the programming mode. The key allows for moving around the main parameters groups, e.g.: Ch1, bAr1, AL1, AL2,etc.

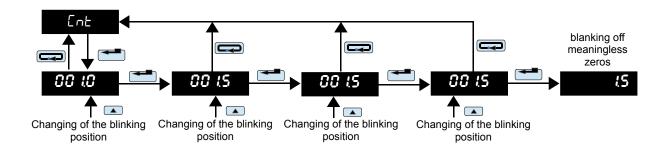

Pressing the key on the given level, causes the entry into parameters of this level. Moving around a given level takes place by means of the key. To change the value, use the key. To cancel the parameter change, press the key. The same key is used to exit the selected level and programming matrix to the measurement.

The transitions matrix in the programming mode is shown in Figure 9.

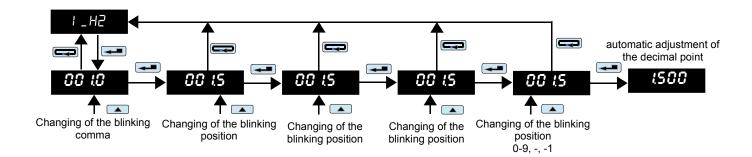

During operation of the meter in the programming mode, the measurement result is displayed on the bar graph, except for selecting the display test function.

Examples of changing the value of the selected parameter (parameter - symbol)

Example of changing the value of the selected parameter with a fixed decimal point (numeric parameter)

Example of changing the value of the selected parameter with a variable decimal point (numeric parameter)

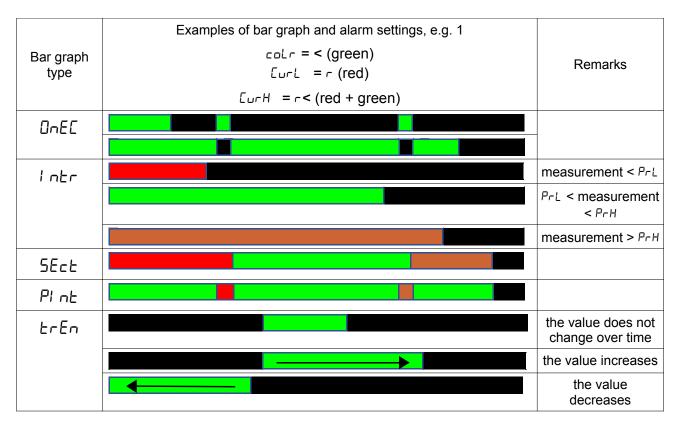

Fig. 12 Bar graph operation modes

#### Caution!

 the meter operates within the measurement range defined by the user in the LoIn and Hiln parameters. Outside the defined range, the meter signals exceeding the range.

- in the case of a meter with a resistance thermometer in a two-wire system, the choice of the option of automatic compensation of changes in the resistance of the wires will result in faulty operation of the meter and displaying the ErrE message.
- when individual display characteristics are switched on, the result is converted according to the sectional characteristics in accordance with the introduced parameters IH01 ... IH21 and dY01 ... dY21.
- when arithmetic functions and individual characteristics are switched on, the arithmetic operations are performed first and the result obtained is transformed by individual characteristics.
- when the individual characteristics for the analog output is switched on, the displayed value is linearly transformed according to the entered d\_H1, d\_H2 and O\_Y1, O\_Y2 parameters.
- the meter regularly controls the values of the entered parameter. If the entered value exceeds the upper or lower range of changes, the meter will not record the parameter.
- if the input type is changed, the decimal point is changed at the same time, optimally for the given input.
- after a power failure, the current time is reset.
- recording is switched off when:
  - it was disabled from the meter menu level
  - the input type was changed
  - the recording start time was changed
  - the recording interval was changed
  - setting the averaging time for the Ent measurement to 0
  - memory full
  - power on the meter

- on a bar graph working in Inter or 5Ect mode, it is possible to set only one Eurt and EurH alarm markers (from one alarm). Setting markers for the selected alarm activates them on the bar graph and automatically disables the markers from other alarms assigned to the same measurement channel.
- the max and min values are erased in case of change of
  - Input type
  - individual characteristics (on, off)
  - restoring factory parameters

| Parameter description | Factory parameter | Parameter description | Factory parameter |  |  |

**CAUTION:** Restoration of factory parameters is possible by holding down all the keys when the power is turned on and holding them down for about 2 seconds, and then releasing them.

#### 6. RS-485 Interface

The digital programmable NA5Plus meters have a serial link in the RS-485 standard for communication in computer systems and with other devices that perform the Master function. The MODBUS communication protocol has been implemented on the serial link. The data transmission protocol describes methods of information exchange between the devices through the serial link.

#### 6.1. Serial interface connection method

The RS-485 interface allows direct connection of up to 32 devices on a single link of the length of up to 1,200 m. To connect more devices, it is necessary to use additional intermediary-separating systems.

Interface line outputs are shown in Fig. 3 of this manual. To obtain correct transmission it is necessary to connect lines A and B in parallel with their equivalents in other devices. The connection must be made with a shielded conductor and the shield must be connected to the protective terminal at a single point. The GND line is used for additional protection of the interface line for long connections. GND signals should be connected between the devices and at one point to the protective terminal (this is not necessary for correct operation of the interface).

To obtain a connection with a PC, a converter from available computer interfaces to RS-485 is necessary, e.g. RS-232 to RS-485 (PD5 from LUMEL SA), USB to RS-485 (PD10 from LUMEL SA) or a dedicated RS-485 interface card installed in the computer.

The marking of transmission lines for the card in the PC depends on the card manufacturer and should be included in the instruction manual of the card.

#### 6.2 MODBUS protocol

List of serial link parameters for the MODBUS protocol:

address of the meter 1...247

baud rate
 2400, 4800, 9600, 19200, 57600, 115200 bit/s
 operating mode
 RTU 8N1, RTU 8N2, RTU 8E1, RTU 8O1

maximum response time
 500 ms

The configuration of the serial link parameters consists in determining the baud rate (bAud), device address (Addr), and operating mode (nodE).

**Caution:** Each meter connected to the communication network must:

- have a unique address
- the same baud rate and operating mode

## 6.3 Description of the MODBUS protocol functions

The following functions of the MODBUS protocol have been implemented in the NA5Plus meters:

| Code      | Meaning                        |  |  |  |  |  |  |
|-----------|--------------------------------|--|--|--|--|--|--|
| 03 (03 h) | readout of n-registers         |  |  |  |  |  |  |
| 06 (06 h) | recording of a single register |  |  |  |  |  |  |
| 16 (10 h) | recording of n-registers       |  |  |  |  |  |  |
| 17 (11 h) | slave device identification    |  |  |  |  |  |  |

#### Readout of n-registers (code 03h)

This function is not available in the publication mode.

**Example**. Readout of 2 registers, starting with the register addressed 1DBD (7613)

#### Request:

| Device<br>address | Function |    |    |    | Number of registers Lo |       |
|-------------------|----------|----|----|----|------------------------|-------|
| 01                | 03       | 1D | BD | 00 | 02                     | 52 43 |

#### Response:

| Device<br>address | Function | Number of bytes |    | Value from register<br>1DBD (7613) |    | •  |    |    |    |    | Checksum<br>CRC |
|-------------------|----------|-----------------|----|------------------------------------|----|----|----|----|----|----|-----------------|
| 01                | 03       | 80              | 00 | 00                                 | 00 | 00 | 00 | 00 | 00 | 00 | 95 D7           |

#### Record of values into the register (code 06h)

This function is available in the publication mode.

**Example**. record of the register addressed 1DBDh (7613)

#### Request:

| Device address | Function | Register addres<br>Hi | Register addres<br>Lo |    | ue fror<br>DBD h | _  |    | Checksum<br>CRC |
|----------------|----------|-----------------------|-----------------------|----|------------------|----|----|-----------------|
| 01             | 06       | 1D                    | BD                    | 3F | 80               | 00 | 00 | 85 AD           |

#### Response:

| ĺ | Device  | Function | Register addres | Register  | Valu | e from r | egister | 1DBD | Checksum |
|---|---------|----------|-----------------|-----------|------|----------|---------|------|----------|
|   | address |          | Hi              | addres Lo |      | h (7     | '613)   |      | CRC      |
|   | 01      | 06       | 1D              | BD        | 3F   | 80       | 00      | 00   | 85 AD    |

#### Record into n-registers (code 10h)

This function is available in the publication mode.

**Example.** Recording 2 registers, starting from the register addressed 1DBD h (7613)

#### Request:

| evice<br>dress | Fun<br>ction | _  | ister<br>ress | C  | nber<br>of<br>sters | Number of bytes |    | Value from register<br>1DBD h (7613) |    | Value from register<br>1DBE h (7614) |    |    |    | Checksum<br>CRC |       |
|----------------|--------------|----|---------------|----|---------------------|-----------------|----|--------------------------------------|----|--------------------------------------|----|----|----|-----------------|-------|
|                |              | Hi | Lo            | Hi | Lo                  |                 |    |                                      |    |                                      |    |    |    |                 |       |
| 01             | 10           | 1D | BD            | 00 | 02                  | 80              | 3F | 80                                   | 00 | 00                                   | 40 | 00 | 00 | 00              | 03 09 |

#### Response:

| Devic | -  | Register addres Hi | Register addres Lo | Number of registers Hi | Number of registers Lo | Checksum CRC |
|-------|----|--------------------|--------------------|------------------------|------------------------|--------------|
| 01    | 10 | 1D                 | BD                 | 00                     | 02                     | D7 80        |

#### Device identification (code 11 h)

**Example**. Readout of data identifying a device for NA5Plus meter

Request:

| Device address | Function | Checksum<br>CRC |
|----------------|----------|-----------------|
| 01             | 11       | C0 2C           |

Response:

| Device<br>address | Function | Number of bytes | Device ID | State of the device | Field<br>depending on<br>device type | Checksum<br>CRC |
|-------------------|----------|-----------------|-----------|---------------------|--------------------------------------|-----------------|
| 01                | 11       | 19              | E1        | FF                  | xxxxxxxxxx                           |                 |

Device address - depending on the setpoint

Function - function no. (11 h)

Number of bytes - 19 h
Device ID - E1 h
Device state - FF h

Field depending on device type - device name

- software version

## 6.4 Map of NA5Plus meter registers

| Address range | Value type      | Description   |
|---------------|-----------------|---|
| 7000          | float (32 bits) | Value is placed in two successive 16-bit registers. Registers contain the same data as 32-bit registers of 7500 range. Registers are read-only.                                 |
| 7100          | float (32 bits) | Value is placed in two successive 16-bit registers. Registers contain the same data as 32-bit registers of 7700 range. Registers can be read out and recorded.                  |
| 7200          | float (32 bits) | Value is placed in two successive 16-bit registers. Registers contain the same data as 32-bit registers of 7600 range. Registers can be recorded and read out.                  |
| 7320          | float (32 bits) | Value is placed in two successive 16-bit registers. Registers contain the same data as 32-bit registers of 7660 range. Registers can be read out and recorded or only recorded. |
| 7500          | float (32 bits) | Value is placed in 32-bit register. Registers are read-only.  |
| 7600          | float (32 bits) | Value is placed in 32-bit register. Registers can be recorded and read out.   |
| 7660          | float (32 bits) | Value is placed in 32-bit register. Registers can be read out and recorded or only read ut.   |
| 7700          | float (32 bits) | Value is placed in 32-bit register. Registers can be recorded and read out.   |

## 6.5 Registers for recording and reading.

| Value is placed in two successive 16-bit registers. These registers contain the same data as 32-bit registers of 7600 area. | Value is placed in 32-bit registers. | Symbol     | Writing (w)/ readou t(r) | Range         |               | Description  |
|---|--------------------------------------|------------|--------------------------|---------------|---------------|--|

## 7. Meter configuration with E-Con software

NA5Plus meter can be configured using the E-Con software. This program is a free application available on the manufacturer's website (<a href="www.lumel.com.pl">www.lumel.com.pl</a>). The meter should be connected to PC via RS485 interface. After starting the program, select the serial port to which the meter is installed. Available serial ports and connection configurations are available in the "Communication" tab.

When connected via the RS485 interface, set the following transmission parameters: the address (device ID), the speed and mode. Factory settings of RS485 interface are as follows: Address 1, speed 15200, mode RTU 8N1.

After setting the parameters, select the "connect" key.

Before changing the configuration of the meter, it is advisable to read and save the current configuration to a file to be able to restore the previous configuration. From e-Con application menu it is possible to save the configuration to a file, to read the file and also export the configuration to a pdf file.

After connection, e-Con automatically read the current configuration from the device. The parameters available for configuration, as well as a preview of the currently measured values at the inputs, are available in the right part of the main program window.

#### 8. METER PROGRAMMING EXAMPLES

**Example 1.** Programming of individual characteristics.

We want to program the meter so that the measured value 4.00 mA corresponds to the value 0 on the display, while the measured value 20.00 mA corresponds to the value 100. To do this:

- set the display precision to 0000 (parameter  $d_{\perp}P = 0000$ )
- enable individual characteristics (parameter  $| \neg d | = \square \neg$ )
- set the number of characteristics points to 2 (parameter P = 2)
- set the point | H□ | = 4.00 and dy□ | = 0
- set the point | HD2 = 20.00 and d GD2 = 100

#### **Example 2.** Programming of the reverse individual characteristics.

If we want to program the meter so that the measured value 4.00 mA corresponds to the value 120.5 on the display, and the measured value 20.00 mA to value 10.8, we should:

- set the display precision to 000.0 (parameter  $d_P = 000.0$
- enable individual characteristics (parameter i ndi = □n)
- set the number of characteristics points to 2 (parameter Pt5 = 2)
- set the point | H□ | = 4.00 and dy□ | = 120.5
- set the point | H02 = 20.00 and d902 = 10.8

#### **Example 3. Programming the alarm with hysteresis**

If we want to program the alarm 1 operation so that at the value of 850 °C for the input the alarm is switched on and at 100 °C it is switched off:

- set the lower alarm threshold 1 to 100 (PrL = 100)
- set the upper alarm 1 threshold to 850 (PrH = 850)
- set alarm type 1 as normally enabled (parameter ŁℲℙ℞ = ¬¬□¬)

#### **Example 4.** Programming the alarm in a desired interval with a delay

If we want to program the alarm 1 operation so that it is switched on in the range of 100 V to 300 V for the input, but with a delay of 10 seconds, then:

- set the lower alarm threshold 1 to 100 (PrL = 100)
- set the upper alarm 1 threshold to 300 (PrH = 300)
- set alarm type 1 as normally enabled (parameter type =  $\square \cap$ )
- set the alarm 1 delay to 10 seconds (parameter dLy = 1□)

If the alarm condition lasts longer than 10.0 seconds, the meter will activate the alarm output.

#### **Example 5.** Analog output programming

If we want to program the current output of the meter so that the measured value of 0.00 mA for the input corresponds to 4.00 mA on the output, while the measured value 20.00 mA corresponds to 20.00 mA, we should:

- enable individual characteristics for the output (parameter  $! \cap d\Omega = \Omega \cap$ )
- set the first point of the characteristics: d\_H I = 0.00, □\_Y I = 4.00
- set the second point of the characteristics:  $d_{\perp}H_{\parallel} = 20.00$ ,  $Q_{\perp}H_{\parallel} = 20.00$

#### **Example 6.** Bar graph programming

If we want to program the bar graph 1 as a sector - the red colour between the PrL and PrH parameters:

- for the bar graph, set the LYPb = 5Ect parameter
- for the bar graph set the  $coL_r = r$  parameter

#### **Example 7.** Programming the magnifier on the bar graph

If we want to program the bar graph to be blanked for the value 0, and for the value 150 to be fully lit, we should:

35

- for the bar graph, set the brL = 0 parameter
- for the bar graph, set the  $b_c H = 150$  parameter

#### **Example 8.** Recording programming

If we want to program the recording of the input every 20 seconds from 12:30, we should:

- set the recording date and time for input 1 (parameters Hr\_ 1, dR\_ 1)
- set the input 1 recording interval to 20 seconds (parameter | nt |)

#### 9. BEFORE YOU REPORT A DEFECT

In the case of improper operation of the meter, verify the fault in the following table:

| Symptom   | Procedure   |
|---|---|
| There are no indications on the display, the bar graph indicates nothing.   | Check the meter power supply connection   |
| The display shows the time, e.g. H_12 alternately with 20:43  | The averaging time Cnt = 0 has been introduced, the meter operates in sleep mode and displays the current time  |
| The display shows the characters:   | Check the correctness of the input signal connection. See the service manual. Check also the setting of parameters D_P, Ind, LoIn and Hiln.   |
| A signal that does not meet our expectations appears on the analog output of the meter                                      | Check if the resistance of the analog output is in accordance with the technical data. Check if the individual characteristics for the output is not switched on. If necessary, change the parameters of the characteristics or enter factory parameters.   |
| It is not possible to enter the programming mode, request for an access code  | The programming mode is password protected. You must enter the correct password. If the user has forgotten the password, please contact the service   |
| It is not certain whether all segments of the display or bar graph are in working order                                     | Enter the meter menu and enable the test of displays and bar graphs. The character fields are lit successively from 0000 to 9999, at the same time the subsequent colours of bar graphs are lit. If any display segment or bar graph point does not light, report the fault to the nearest service centre |
| While navigating the meter's menu, the parameter values that do not match the scope of their changes appear on the display. | Enter the meter menu and reset the meter to its factory settings.   |
| The display shows a result that is not in line with our expectations  | Check if the individual characteristics is not switched on. If necessary, restore the meter factory parameters.   |

| The bar graph does not work as we expect   | Check the parameters of the bar graph. In case of further incorrect operation, restore the meter factory parameters and perform a display test.   |
|--|---|
| Despite exceeding the alarm threshold, the alarm relay does not turn on                                      | Check and if necessary correct the value of the alarm delay.  |
| Instead of displaying the measurement result, the meter displays the parameter symbol and its value          | The meter operates in the parameter preview mode or in the programming mode. Press the cancel key.  |
| A delay in the activation of the alarm was introduced, e.g. 30 s, but the alarm did not work after this time | The duration of the alarm occurrence condition was shorter than the programmed one, i.e. the alarm condition subsided before the delay time elapsed. In this case, the meter starts counting down the time from the beginning |
| The meter does not establish communication with the computer via the RS-485 interface                        | Check if the interface cables (A, B, GND) have been correctly connected and then check the interface parameters in the meter menu. These parameters must be compatible with those in the software used                        |

#### 10. SOFTWARE UPDATE

The meter software update can be done via a PC with installed free e-Con program. e-Con program and the current update file are available on the website <a href="www.lumel.com.pl">www.lumel.com.pl</a>. Update can be performed via the RS-485 interface.

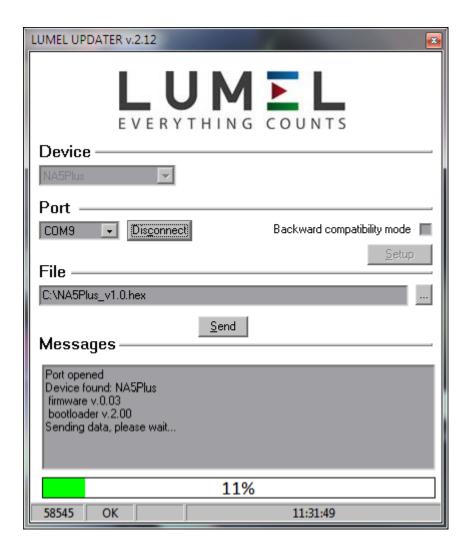

Fig 13: Software update

**Caution!** It is recommended that before updating the meter software, the user should read and save the current configuration of the meter to a file.

After starting the e-Con, set the communication parameters in the *Communication* field on the left side of the main window, then select *Connect*. The meter will be automatically recognized.

When communication is established it is recommended to read the current configuration of the module and save it to a file. for later restoration.

Then select *Firmware Update* on the right side of the program menu. LUMEL UPDATER (LU) will be launched (Fig. 16). NA5Plus meter is supported by LU starting from version 2.09. Select the device (NA5Plus) in the program, the port on which the device is installed in Windows, set the appropriate transmission parameters (115200, 8n1) in the access window under *Setup*, and indicate the update file. Then establish connection using *Connect* button. The Messages window

displays information about the detected device and the update progress. After the meter is properly detected by LU, you must start the update by selecting *Send* button. LU will show the update progress bar with percentage information, and the NA5Plus meter will indicate the updating process on the display throughout the update. After the update is completed, the meter will restart, restore factory parameters and start normal operation. LU message window will display *Done* and the meter update duration. LU program can be closed and then we can read the previous configuration from the file and save it to the meter using e-Con.

**Caution!** If the connection is interrupted or the power is turned off while updating the meter software, it may cause permanent damage to the device.

#### 11. TECHNICAL DATA

#### Input:

| Pt100           | (-200850) °C  |
